

UPC Interconnection Billing successfully integrated on the "Magenta Network Billing Platform" - based on NEWCON OSS/BSS IntegrationLayer™ technology

With an extremely lean and effective project organization, Magenta IT together with the platform supplier NEWCON succeeded in migrating the UPC Interconnection Billing to the Network Billing Platform implemented at Magenta in a very short time. This platform is based on the technology of the NEWCON OSS/BSS IntegrationLayer™ and offers Magenta with its modular, service oriented overall concept a broad basis of different services, both in the national and international context. Essential advantages of the integration and migration of this "service" on one platform are the uniform invoicing for Magenta & UPC as well as the automated booking of service charges. The already existing "Revenue Assurance Stream" can also be used to centrally check incoming invoices or to use existing processes. Established processes for IT and the business departments involved remain unaffected, so there are no additional operational costs in IT or in the business departments. In the course of this "UPC/Magenta Project", preliminary work has already been done for the subsequent replacement of the "Liberty Mediation System". This service & system migration project was also one of the first fully completed integration projects in the course of the takeover of UPC by Magenta Austria. A major highlight of the project implementation is that the entire project was realised in the sense of a "Test-Driven Development Approach" and thus the first mapping of fixed-line telephony in Magenta IC billing was put into operation quickly and with an appealing quality.

This is confirmed by Michaela Wegenkittl, Vice President Core IT Services at Magenta: "We were able to achieve the agreed project goals and landed a precision landing. The cooperation of all parties involved worked perfectly. "
